

“Because I work with other organizations to ensure successful implementation of our projects, it is very important for me to understand and know how to work with different people, and sharpen my project management and communication skills. All these skills I hope to improve through the Coady education.”

Luyando Mbozi

Country Director

Kulemela, Zambia

The focus of my work with my organization is to improve engineering and technical education by demonstrating and implementing the benefits of hands-on learning through engineering design competitions. My task involves working with various stakeholders, the universities, colleges, primary/secondary schools, the Engineering Institution of Zambia and other stakeholders to ensure that each stakeholder is aware of its roles and contributions and thus ensuring a successful competition at any particular school.

Because many technical colleges and universities engage in education that is mainly lecture-based as a result of inadequate equipment, students have limited opportunities to enjoy the benefits of hands-on learning, design consideration in curriculum and entrepreneurship.

Kulemela gives a platform to engineering and technical students to have these opportunities through engineering design competitions.
